Covid-19 virus stays in body for 90 days🥺🌸

Isolation period of Covid-19 patients being re-evaluated

KANIZA GARARI IDC HYDERABAD, SEPT. 25

The Covid-19 causing SARS-CoV-2 stays for 90 days in the bodies of critically ill patients who have recovered, according to analysis of clinical data obtained from various hospitals.

The assessment shows that these patients are likely spreaders of the disease. For that reason, the isolation period in those who have suffered from Covid-19 is being re-evaluated.

The Centers for Disease Control and Prevention in Atlanta, USA, in its assessment of data has found that mild and moderate are infectious last only 10 days. Those who are immune-compromised are infectious for 30 days. Those who are severely immune-compromised and suffered critical illness are infectious for 90

- 15 minutes is the time for the infection to pass from one person to another.
- Home isolation is the best modality for treatment for mild and moderate cases.
- Mortality increases after 12 years of age.
- Masks and social distancing are the best universal prevention methods and must be strictly followed.
- Super spreaders are the ones who shed the most virus and for that reason public gatherings must be avoided.

days. After 90 days, the impact of other diseases of infectious in form are not Covid-19.

Dr Mustafa Afzal, senior infectious disease specialist at Care Hospitals, said, "The assessment is impor-

tant to understand the isolation process. For health-care workers, we are finding that RT-PCR is positive but they are asymptomatic. In this category of patients, the antibody levels are being checked every week. According to the antibody levels, it is decided whether they must re-join duty."

The infection status is important as across all sectors, it is important to get people back to work without fear and stigma. The Confederation of Medical Associations in Asia and Oceania (CMAAO) has derived protocols from various studies for doctors to follow in the region which will help them in understanding and also treating the disease better.

They state that the recommended PCR Ct (cycle threshold) is the gold standard for Covid-19 testing. Ct is important as it helps to know if the test is a false

positive.

Dr K.K. Agarwal, president of CMAAO, said, "We know that zinc is the mineral and Vitamin D the vitamin that require supplementation during the time of the disease. Day five is the most crucial day in Covid-19's phase from the various analysis of critical patients."

He said Day three is when pneumonia may develop and within four days of the fifth day, if till then, pneumonia is not diagnosed it will become a challenge. To reduce mortality it is important that diagnosis must be rightly done and people must approach hospitals on time," Dr Agarwal said.

It is confirmed that loss of smell and taste are the first two symptoms and when that occurs, it is very important to opt for testing. These are the indicators of the virus in present times and they must not be neglected.
